Prototype Example

< ロト < 同ト < ヨト < ヨト

The Best Glass CO. plan to use the remaining time of their production lines to start with the production of two new types of windows – let us call them Windows 1 and Window 2. All of these windows must go through three production lines, where the capacities of the lines are 60, 60, 85 hours. The unit of the first window type needs 2 hours at the first production line, 6 at the second one and 10 hours at the last production line. The unit of Windows 2 needs 10 hours at the first production line, 6 at the second one and 5 hours at the last production line.

The marketing division considers that the company could sell as much of either product as could be produced and it is supposed that the profit from each unit of Windows 1 would be 30 thousand dollars and from each unit of Windows 2 45.

It is not clear which mix of these two products would be most profitable.

Prototype Example – Mathematical Model

イロト イボト イヨト イヨト

Jihočeská univerzita v Českých Budějovicích University of South Bohemi s in České Budějovice

> $\max 30x_1 + 45x_2$ subject to $2x_1 + 10x_2 \leq 60$, $6x_1 + 6x_2 \leq 60$, $10x_1 + 5x_2 \leq 85$, $x_1, x_2 \geq 0$.

First, we need to prepare the data in the Excel sheet. In the first step we rewrite the data of our example in the following way.

| | windows 1 | windows 2 | | capacity |
|--------|-----------|-----------|--|----------|
| line 1 | 2 | 10 | | 60 |
| line 2 | 6 | 6 | | 60 |
| line 3 | 10 | 5 | | 85 |
| | | | | |
| profit | 30 | 45 | | |
| | | | | |
| | | | | |

< - □ > <

Now, we need to add variables. In our prototype example, we have two variables; hence we need to cells for them – we choose two cells and set them to be variables. We put the starting points into them – 0s.

| | windows 1 | windows 2 | | capacity |
|-----------|-----------|-----------|--|----------|
| line 1 | 2 | 10 | | 60 |
| line 2 | 6 | 6 | | 60 |
| line 3 | 10 | 5 | | 85 |
| | | | | |
| profit | 30 | 45 | | |
| | | | | |
| variables | 0 | 0 | | |

Then, we need to prepare all the functions which we use in the model – objective function and all left-hand sides of the constraints.

| | windows 1 | windows 2 | used capacity | | | capacity | |
|-----------|-----------|-----------|---------------|--|------------|---------------------------------|--|
| line 1 | 2 | 10 | | `=SUMPRO | DUCT(B2:C2 | 2 <mark>;\$B\$8:\$C\$8</mark>) | |
| line 2 | 6 | 6 | | `=SUMPRODUCTÍ(B3:C <mark>3;\$B\$8:\$C\$</mark> 8 | | | |
| line 3 | 10 | 5 | | `=SUMPRODUCT(B4:C <mark>4;\$B\$8:\$C\$</mark> 8 | | | |
| | | | | | | | |
| profit | 30 | 45 | | `=SUMPRO | DUCT(B6:C6 | 5;\$B\$8:\$C\$8) | |
| | | | | | | | |
| variables | 5 | 5 | | | | | |

To possible ends of the Solver are:

- Solver found an optimal solution,
- Solver did not find an optimal solution.

Questions as

fakulta

- what does happen if the DM decides to produce a non-optimum product,
- in which price is advantageous to buy more supplies,
- in which price is advantageous to sell a part of supplies,
- if the profit of some product will be changed, will it change the result.
- and so on.

can be often answered without any new optimisation.

Answer Report

Microsoft Excel 16.0 Answer Report Worksheet: [lp.xlsx]Example Report Created: 3/6/2019 10:05:59 AM Result: Solver found a solution. All Constraints and optimality conditions are satisfied. Solver Engine Engine: Simplex LP Solution Time: 0.031 Seconds. Iterations: 2 Subproblems: 0

Solver Options

Max Time Unlimited. Iterations Unlimited. Precision 0.000001. Use Automatic Scaling Max Subproblems Unlimited, Max Integer Sols Unlimited, Integer Tolerance 1%, Assume NonNegative

Objective Cell (Max)

| Cell | Name | Original Value | Final Value | |
|--------|----------------------|----------------|-------------|--|
| \$E\$6 | profit used capacity | 375 | 375 | |

Variable Cells

| Cell | Name | Original Value | Final Value | Integer |
|--------|---------------------|----------------|-------------|---------|
| \$B\$8 | variables windows 1 | 5 | 5 | Contin |
| \$C\$8 | variables windows 2 | 5 | 5 | Contin |

Constraints

| Cell | Name | Cell Value | Formula | Status | Slack |
|--------|----------------------|------------|----------------|-------------|-------|
| \$E\$2 | line 1 used capacity | 60 | \$E\$2<=\$G\$2 | Binding | 0 |
| \$E\$3 | line 2 used capacity | 60 | \$E\$3<=\$G\$3 | Binding | 0 |
| \$E\$4 | line 3 used capacity | 75 | \$E\$4<=\$G\$4 | Not Binding | 10 |
